only give program for jpql query

Got it — here is a **complete, clean JPQL-only program** (minimum required files). No native query included. This will run properly.

Uses **Spring Boot** + **JPQL** + **MySQL**.

✅ 🔷 1. Main Class

Java

```java
package com.example.jpqldemo;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class JpqlDemoApplication {
    public static void main(String[] args) {
        SpringApplication.run(JpqlDemoApplication.class, args);
    }
}
```

✅ 🔷 2. Entity Class

Java

```java
package com.example.jpqldemo.entity;

import jakarta.persistence.*;

@Entity
@Table(name = "patient")
public class Patient {

    @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    private Long id;

    private String name;
    private int age;

    public Patient() {}

    public Patient(String name, int age) {
        this.name = name;
        this.age = age;
    }

    public Long getId() { return id; }
    public String getName() { return name; }
    public int getAge() { return age; }

    public void setName(String name) { this.name = name; }
    public void setAge(int age) { this.age = age; }
}
```

✅ 🔷 3. Repository (JPQL)

Java

```java
package com.example.jpqldemo.repository;

import com.example.jpqldemo.entity.Patient;
import org.springframework.data.jpa.repository.*;
import org.springframework.data.repository.query.Param;

import java.util.List;

public interface PatientRepository extends JpaRepository<Patient, Long> {

    // JPQL Query
    @Query("SELECT p FROM Patient p WHERE p.age > :age")
    List<Patient> findPatientsAboveAge(@Param("age") int age);
}
```

✅ 🔷 4. Controller

Get Plus ×

Java

```java
package com.example.jpqldemo.controller;

import com.example.jpqldemo.entity.Patient;
import com.example.jpqldemo.repository.PatientRepository;

import org.springframework.web.bind.annotation.*;

import java.util.List;

@RestController
@RequestMapping("/api/patient")
public class PatientController {

    private final PatientRepository repository;

    public PatientController(PatientRepository repository) {
        this.repository = repository;
    }

    // Test API
    @GetMapping("/check")
    public String check() {
        return "JPQL API Working";
    }

    // Insert Data
    @PostMapping("/add")
    public String addPatient(@RequestBody Patient patient) {
        repository.save(patient);
        return "Patient added!";
    }

    // JPQL Query API
    @GetMapping("/above/{age}")
    public List<Patient> getPatientsAboveAge(@PathVariable int age) {
        return repository.findPatientsAboveAge(age);
    }
}
```

5. application.properties

properties

```
server.port=8082

spring.datasource.url=jdbc:mysql://localhost:3306/testdb
spring.datasource.username=root
spring.datasource.password=1234

spring.jpa.hibernate.ddl-auto=update
spring.jpa.show-sql=true
```

6. pom.xml

XML

```
<project xmlns="http://maven.apache.org/POM/4.0.0">
    <modelVersion>4.0.0</modelVersion>

    <groupId>com.example</groupId>
    <artifactId>jpqldemo</artifactId>
    <version>0.0.1-SNAPSHOT</version>

    <parent>
        <groupId>org.springframework.boot</groupId>
        <artifactId>spring-boot-starter-parent</artifactId>
        <version>3.2.0</version>
    </parent>

    <dependencies>

        <!-- REST -->
        <dependency>
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-starter-web</artifactId>
        </dependency>
```
