

Here is a **complete, minimum working REST API program** using **Spring Boot**.
This is the simplest setup (no database needed).

✓ 1. Main Class

```
</> Java
package com.example.restapi;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class RestApiApplication {
    public static void main(String[] args) {
        SpringApplication.run(RestApiApplication.class, args);
    }
}
```

✓ 2. Controller (REST API)

```
</> Java
package com.example.restapi.controller;

import org.springframework.web.bind.annotation.*;

@RestController
@RequestMapping("/api")
public class HelloController {

    // GET API
    @GetMapping("/hello")
    public String hello() {
        return "Hello, REST API is working!";
    }

    // Path Variable API
    @GetMapping("/welcome/{name}")
    public String welcome(@PathVariable String name) {
        return "Welcome " + name;
    }

    // POST API
    @PostMapping("/add")
    public String add(@RequestBody String data) {
        return "Received: " + data;
    }
}
```

✓ 3. application.properties

```
</> properties

server.port=8082
spring.application.name=restapi
```

✓ 4. pom.xml

```
</> XML

<project xmlns="http://maven.apache.org/POM/4.0.0">
  <modelVersion>4.0.0</modelVersion>

  <groupId>com.example</groupId>
  <artifactId>restapi</artifactId>
  <version>0.0.1-SNAPSHOT</version>

  <parent>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-parent</artifactId>
    <version>3.2.0</version>
  </parent>

  <dependencies>
    <!-- REST API -->
    <dependency>
      <groupId>org.springframework.boot</groupId>
      <artifactId>spring-boot-starter-web</artifactId>
    </dependency>
  </dependencies>
</project>
```

Get Plus x

✓ Project Structure

```
com.example.restapi
├── RestApiApplication.java
├── controller
│   └── HelloController.java
```

🚀 How to Run

1. Run `RestApiApplication`
2. Open `Postman`

🔥 Test APIs

✓ GET

```
http://localhost:8082/api/hello
```

👉 Output:

```
Hello, REST API is working!
```

✓ Path Variable

```
http://localhost:8082/api/welcome/Mahi
```

👉 Output:
